

AN OTHER YEAR, PONSA IN FORMULA 1

SAFETY in work at height, catapult effect

One of the biggest risks in using boom-type platforms is being catapulted out of the basket. This can happen easily if the boom swings, jolts or tilts away from the machine's centre of gravity..

Even a small movement at ground level will create a "whiplash" effect at platform level.

The higher you are, the faster you will be thrown forwards – or sideways – or backwards.

In the event of an accident, **the platform might tilt** providing less protection than you think.

Professional boom platform operators **never leave anything to chance.**

PONSA Training

What is the OEKO-TEX?

PONSA renews annually the certificate to ensure the quality of their webbings.

The OEKO-TEX Standard is an unified system of control and certification worldwide for raw materials, textile products. Its purpose is to ensure that the textiles are free from harmful substances.

PONSA is certified in Class 1 which is the strictest, it is referring to items for babies and children under 3 year.
